uDropShip Customizations

Adding a vendor field

See example of initial vendor fields configuration in:
app/code/community/Unirgy/Dropship/etc/config.xml

Create a new config file or use your custom module's config.xml

For a standalone customization, can use app/etc/modules/z_custom_fields.xml:

[z_custom_fields.xml](#)

```xml
<?xml version="1.0"?>
<config>
    <global>
        <udropship>
            <vendor>
<!-- If you want to create a new field group, use fieldset (optional):
-->
                <fieldsets>
                    <my_fieldset>
                        <legend>My Fieldset</legend>
                        <position>100</position>
                    </my_fieldset>
                </fieldsets>

                <fields>
<!-- Text field, named 'my_text_field' -->
                    <my_text_field>
<!-- text label for the field, will be shown to admin and vendor -->
                        <label>New Order Carbon Copy Emails</label>
<!-- Fieldset to show the field in, see udropship config.xml for
default ones -->
                        <fieldset>my_fieldset</fieldset>
<!-- Position within the fieldset -->
                        <position>5</position>
<!-- Default value for the field -->
                        <default><![CDATA[Default text]]></default>
<!-- <note> is optional, use for comments on the field for admin and
vendor -->
                        <note>Comma separated</note>
                    </my_text_field>

<!-- Dropdown field -->
                    <my_country_field>
                        <label>3rd Party Country</label>
                        <fieldset>my_fieldset</fieldset>
```

```xml
                        <type>select</type>
    <source_model>adminhtml/system_config_source_country</source_model>
                        <position>5</position>
                    </my_country_field>

                    <my_dropdown_field>
                        <label>My Yes/No Dropdown Field</label>
                        <type>select</type>
                        <fieldset>my_fieldset</fieldset>
<!-- Source for the 'switch' within the class file -->
                        <source>yesno</source>
                        <position>3</position>
<!-- Default value for the field -->
                        <default>0</default>
                    </my_dropdown_field>
                </fields>
            </vendor>
        </udropship>
    </global>
</config>
```

- Field Notes:
    - Fields will be taken automatically from vendor object and serialized into db vendor metafield.
    - If you want to save them in a separate field table, create field with this name in udropship_vendor.
    - It is prudent to use a prefix for field names to avoid conflict with existing fields
- Possible field types:
    - text (default)
    - password
    - textarea
    - select
    - multiselect
    - image
    - date
    - datetime
- If no <source_model> is specified, app/code/community/Unirgy/Dropship/Model/Source.php class will be used.
    - You can create your own combined dropdown source classes by extending this class and overriding toOptionHash() method.
